ISO/IEC 27560-1 Profile: ANCR Notice + Consent Receipt Exchange

A WG5 INFO briefing supporting the **Kantara liaison contribution** — enabling inspectable, interoperable evidence of notice-first accountability and meaningful choice in digital identity consent.

WG5 INFO BRIEFING

KANTARA LIAISON

What We Are Asking WG5 For

This briefing seeks WG5's support for a focused, well-scoped piece of standards work with direct relevance to digital identity interoperability and accountable consent governance.

The Ask

Support for the Kantara liaison contribution on the **ISO/IEC 27560-1 profile** — specifically, the ANCR Notice + Consent Receipt Exchange Profile for digital identity contexts.

The Objective

Enable **interoperable notice and consent evidence exchange** — ensuring that accountability artefacts can be produced, verified, and compared consistently across deployments and jurisdictions.

The Problem We Are Solving

"Consent" is routinely implemented as a **permission prompt** rather than a meaningful, accountable notice-first process. In digital identity and agentic orchestration contexts, this structural gap creates compounding risks.

Weak Accountability

No verifiable record of who gave notice, when, or under what governance obligations — leaving controllers unaccountable and individuals unprotected.

Poor Interoperability

Inconsistent consent artefact formats mean that records cannot be compared, verified, or enforced across services or borders.

Unverifiable Choice

Without inspectable evidence that meaningful choice preceded identification, assertions of compliance remain unverifiable by design.

Human Consent Pattern

In the physical world, meaningful choice rests on a well-understood sequencing that digital systems routinely bypass.

1 Identify who is accountable

The individual knows who is responsible before any transaction begins.

2 Understand what will happen

Clear, prior notice of purpose and use — not buried in policy documents after the fact.

3 Decide before identification is demanded

Choice precedes disclosure; identification is never a precondition of receiving a notice.

Profile Intent: Mirror this offline sequencing online — making notice-first, choice-before-identification the default rather than the exception in digital identity contexts.

What ISO/IEC 27560 Already Gives Us

The existing standard provides a solid, implementable foundation — one that the proposed profile builds upon rather than replaces.

Standard Information Structure

A consistent schema for consent records and receipts — giving implementers a shared vocabulary for consent artefacts across deployments.

Exchangeable Artefacts

A foundation for producing consent records that can be shared, compared, and verified — not merely stored locally for internal audit.

Governance Expression

Structured fields — including the **Code of Conduct** field — allow governance commitments to be expressed directly within the consent record, not just referenced externally.

Open Access Progress

Broader community availability has enabled implementation and profiling work to proceed — creating the conditions for the 27560-1 profile effort.

Where This Fits: 27560:2023 → 2026 Profile

The work spans two complementary horizons: immediate implementation under the existing standard, and a proposed 2026 profile that standardises the ANCR exchange pattern as a durable interoperability layer.

Now — ISO/IEC 27560:2023

Implementable today using existing artefacts. The **Code of Conduct** field anchors governance commitments within current deployments, with no profile update required.

Convention 108+ Alignment

Code of Conduct commitments expressed consistently with **Convention 108+ Article 11** expectations — enabling enforceable safeguards and accountable practice at scale.

1 2 3

2026 — 27560-1 Profile

Proposed profile clarifies and standardises the **ANCR exchange pattern** as a consistent interoperability layer for digital identity consent across services and jurisdictions.

CONFORMANCE + COMPLIANCE

TPI (Glass-boxed Governance)

Transparency Performance Indicators (TPI) add a structured measurement layer to the ANCR framework — transforming governance claims into inspectable, comparable evidence.

→ Make trustworthy use inspectable

Evidence of what was disclosed, when it was disclosed, and under what governance constraints — replacing assertion-based compliance with verifiable records.

→ Enable consistent comparison

Implementers and participating regulators can compare deployments across contexts using a shared set of conformance and compliance signals.

→ Support regulatory engagement

TPI signals provide a common reference point for regulators reviewing digital identity deployments — reducing interpretive burden on both sides.

What the ANCR 27560-1 Profile Adds

The profile is additive — it specifies the exchange pattern that turns individual consent records into a scalable, interoperable accountability layer for digital identity.

Controller Identification Record

Anchors accountability to a verifiable controller identity — establishing who is responsible before any personal data exchange begins. Specified in the Core 27560 information structure

Consent Receipt Schema

Builds directly on the 27560:2023 schema — extending it with ANCR-specific fields that support notice-first sequencing and governance expression.

ANCR Receipt Exchange Pattern

Specifies the **exchange pattern** for digital identity consent — enabling governance interoperability across services, deployments, and jurisdictions.

Inspectable Before Identification

Evidence that scales: notice-first accountability and verifiable choice recorded before any identification step is initiated or required.

ANCR Exchange: 4-Stage Pattern

The exchange pattern provides a sequential, verifiable chain of accountability artefacts — from initial notice through to a portable, revocable evidence token.

1

Stage 1: Notice Receipt

Proof-of-notice issued to the individual. **Controller accountability is established first**, before any identification or data exchange is requested.

2

Stage 2: Consent Receipt

Meaningful choice is recorded — a structured artefact documenting the individual's decision under the disclosed terms, with a clear audit trail.

3

Stage 3: Micro-notice Credential

A **runtime-verifiable artefact** — a compact, machine-readable notice credential that can be checked at the point of service without requiring full receipt retrieval.

4

Stage 4: Notice Token

A **portable, revocable evidence token** bound to a specific notice state — enabling withdrawal of consent and propagation of notice-state changes across services.

INTEROPERABILITY RATIONALE

Why Exchange, Not Just Storage

A locally stored consent record satisfies internal audit requirements. Interoperability demands substantially more — and the distinction matters at scale.

Consistent Artefact Formats

Records must be structurally comparable across different implementations — not just internally consistent within a single service.

Verifiable Sequencing

The chain of **notice → choice → enforcement** must be auditable by external parties, not merely asserted by the controller.

Cross-jurisdiction Portability

Artefacts must be portable across services and jurisdictions — enabling individuals and regulators to verify consent evidence wherever it is presented.

Digital Transparency Risk Assurance

The framework introduces four levels of trusted transparency assurance — calibrated to deployment risk and designed to make transparency evidence testable and comparable, not merely claimed, according to digital scope of disclosure

1

Level 1 — Basic Disclosure

Minimum notice structure present; artefacts produced but not independently verified.

2

Level 2 — Structured Evidence

Consistent schema used; notice-first sequencing demonstrable; artefacts exchangeable.

3

Level 3 — Verifiable Governance

Code of Conduct commitments expressed and verifiable; TPI signals available for regulatory review; suitable for regulated digital identity deployments.

4

Level 4 — Assured Interoperability

Full ANCR exchange pattern implemented; cross-jurisdiction portability; applicable to AI-enabled orchestration and high-risk digital identity contexts.

These levels apply directly to digital identity and **AI-enabled orchestration contexts** — providing a consistent benchmark for comparing deployments and informing regulatory engagement.

What We Want Feedback On

WG5's perspective is valuable at precisely this juncture — before profile text is finalised — where input on fit, framing, and terminology can most effectively shape the outcome.

Profile Fit

Where does WG5 see the strongest fit for **profiling guidance**? Is the 27560-1 profile the right vehicle, or should elements be carried via other liaison or normative mechanisms?

Terminology Alignment

Are there **terminology conflicts or gaps** with existing WG5 frameworks — particularly around notice, consent, and accountability — that the profile should address explicitly?

Conformance and Testability

How should the profile structure its **conformance and testability hooks** to align with WG5's existing approach to interoperability specifications?

Surveillance-by-Default Risk

How can the profile be positioned to support genuine interoperability without inadvertently creating **infrastructure that amplifies surveillance-by-default** patterns in digital identity systems?
