

ANCER Extension for ISO/IEC TS 27560:2023

Release 1: notice records, notice receipts and the notice event log

ISO/IEC JTC 1/SC 27/WG 5, 57th meeting, Kaunas. Agenda item 37

Mark Lizar, editor

Kantara Initiative, Anchored Notice and Consent Receipt (ANCER) Working Group

Processing records hold the consent event, not the consent record

ISO/IEC CD 27560.2 is titled *Structure of Personally Identifiable Information (PII) Processing Records* (stage 30.60). A PII processing record is the controller's record of its own processing. What it can hold of a consent is the event, not the record of consent.

	Consent record	Consent event record
Defined in	TS 27560:2023, 3.3; Extension 3.22	Extension 3.30
Held by	The individual. Bilateral	The PII controller, privately, in its record of processing activities
What it records	The consent, and the time and manner of the individual's acceptance of the notice	An event in which consent is given, refused, modified or withdrawn
Bound to	The Anchored Notice Receipt on which the consent depends	The notice version and the Anchored Notice Receipt
Where it sits	The consent record information structure, TS 27560:2023	Profile B1, PII processing record structure

7.2.2: implementations shall distinguish the two in naming and in reference. A consent event record that assumes the identity and location of the individual shall not be exchanged, mapped or reported as equivalent to a consent record.

Clauses: ISO catalogue, ISO/IEC CD 27560.2; TS 27560:2023, 3.3; Extension 3.22, 3.30, 7.2.2, B.1

How it extends the consent record information structure

Profiles and extends ISO/IEC TS 27560:2023. It is not a stand alone specification.

An implementation that conforms to the Extension conforms to the TS for the record content it carries.

It adds four artefacts the TS does not specify:

- Controller Identity Record: who is accountable (7.1)
- Notice Version Object: which notice, hashed and time stamped (7.2.4)
- Authorization State Object: the state of each purpose over time (7.2.5)
- Notice Event Log: issuance and every material change (7.4)

One declared deviation (A.0): pii_principal_id is not required. A required principal identifier makes the evidence unobtainable without identifying the person. Every other difference is a constraint, a specialization or an additive field.

Field mapping, Annex A.2

TS 27560:2023 anchor	Extension field or object
party_id	controller_identity_record_id
privacy_notice, reference	notice_id and notice_version_reference
privacy_notice, reference (no integrity data)	Notice Version Object: notice_url, notice_hash, published_at
event_time	presented_at
6.3.7.6 event_state, closest anchor	Authorization State Object

Clauses: Foreword; 5; 7.1; 7.2.4; 7.2.5; 7.4; A.0; A.2

Inspectable before identification, not held behind the controller

Public

Retrievable by any party without authentication

- Controller Identity Record: retrievable without authentication, before any demand for identification. Retrieving it is not an identification event (7.1)
- Notice Version Object for each version: notice_url, notice_hash, published_at (7.2.4)
- Disclosure set: publicly retrievable and bound to the version in effect (7.2.1)
- Notice event log: notice_event_log_url in the CIR, publicly discoverable when present (7.1.2)

Bilateral

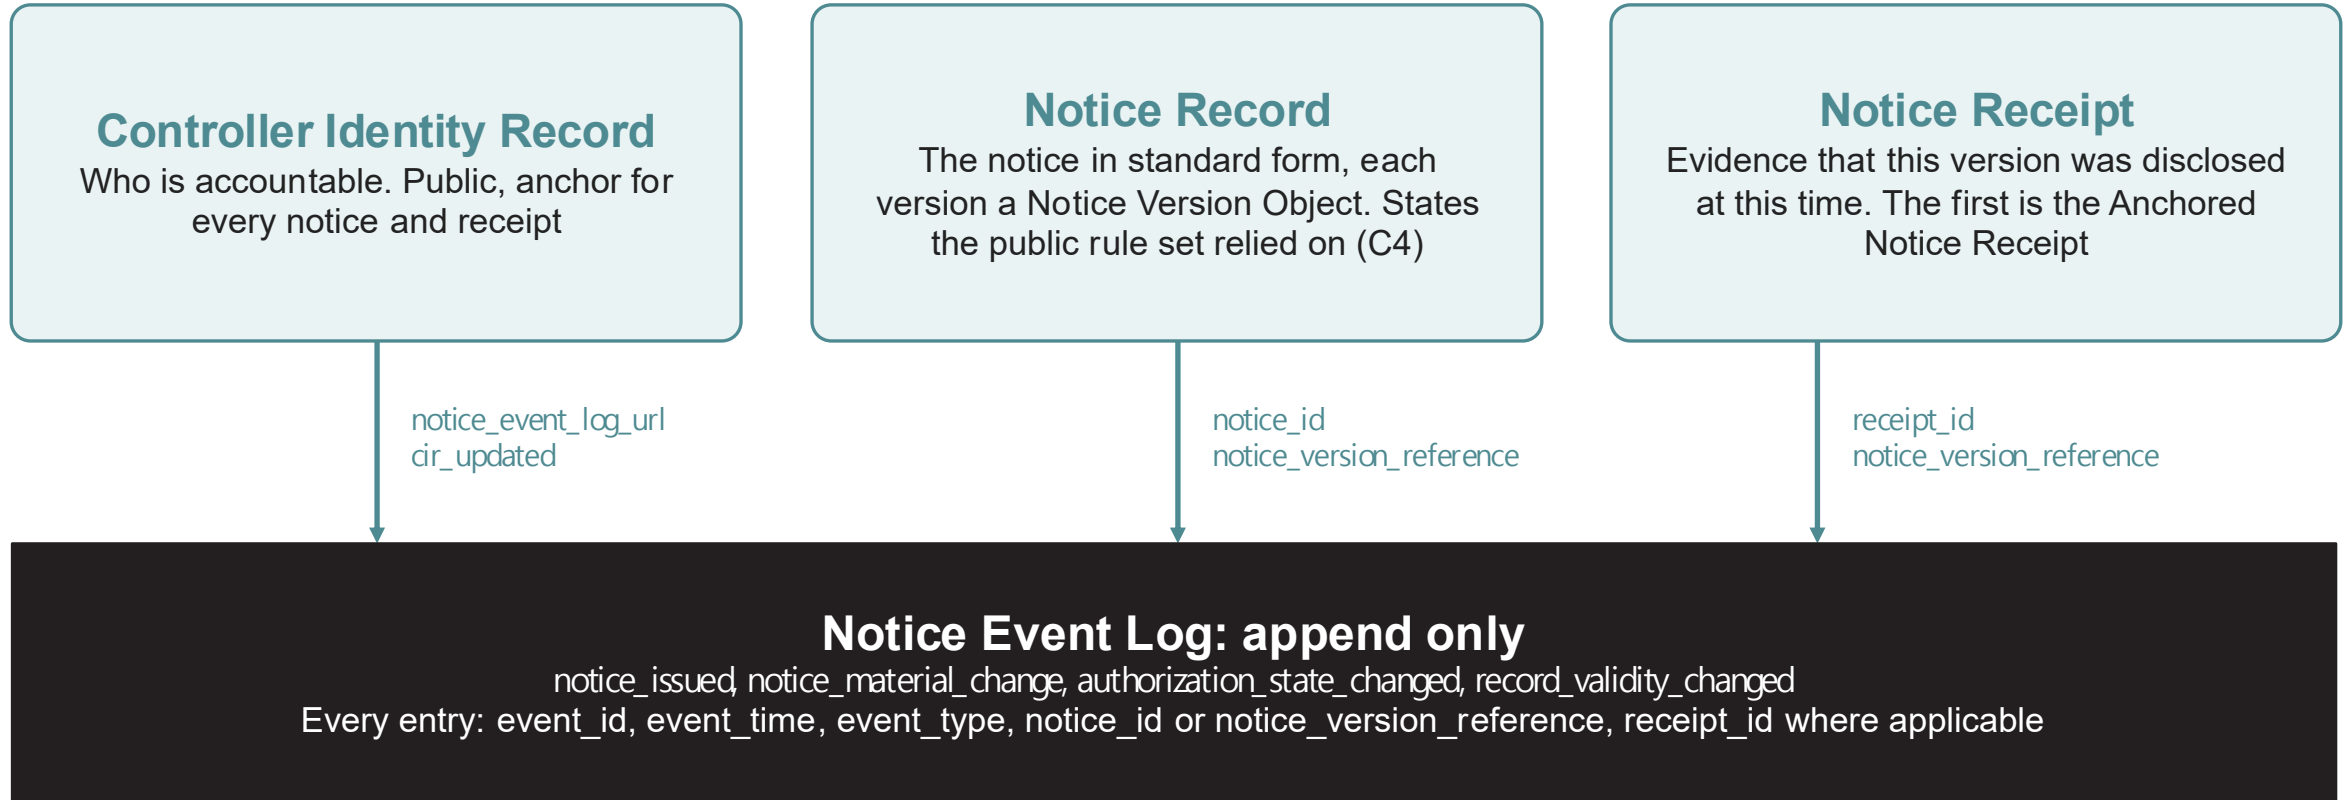

Held by both parties, not required to be published

- Notice Receipt and the Anchored Notice Receipt: held by the controller and by the individual (7.3.2)
- Authorization State Object: bilateral (7.2.5)
- No account_id or pii_principal_id required to generate, keep or verify the receipt (7.3.1)

Any relying party can verify a notice without asking the controller: retrieve the version at notice_url, hash it, compare with notice_hash. A notice altered after disclosure is detected (7.2.4).

Clauses: Introduction; 1; 7.1; 7.1.2; 7.2.1; 7.2.4; 7.2.5; 7.3.1; 7.3.2

Three records, one notice event log

The join is the notice version. A material change creates a new version and a new log entry; historic versions are kept while any record depends on them (6.3).

Clauses: 3.1 to 3.6; 5.1 C4; 6.2; 6.3; 7.1.2; 7.3; 7.4.1; 7.4.2

What the linked record keeps track of

	How the record carries it	Clause
Relationship	The controller is identified before the person is. The receipt is held by both parties.	7.1; C1; 3.3
Purpose	Recorded before identification or transfer, bound to the legal authority, the controller and the notice version.	7.5
Permissions	Per purpose state: not_given, given, altered, restricted, objected, withdrawn, expired. Each change is a new instance, logged, never overwritten.	7.2.5; 7.4.1
Context	Lawful basis per purpose. Processing events recorded separately from notice events, each bound to the notice version relied on.	7.4.4; Annex C

The state at any past time is reconstructable from the record (7.2.5, reconstruction procedure). Either party can inspect it, under the controller's rules and the public rules at the same time.

Clauses: 3.3; 5.1 C1; 7.1; 7.2.5; 7.4.1; 7.4.4; 7.5; Annex C

What notice records and receipts make possible

Clean AI

Processing, including by AI systems, is recorded against the notice version, purpose and lawful basis it relied on. Processing bound to no notice version and no recorded purpose is detectable.

7.4.4; 7.5

Operational transparency

Who is accountable, which notice version, and when, are checkable from the record at the time of interaction, not reconstructed afterwards. Conformance is asserted per notice version.

7.2.4; 5.1

Cross-border transparency

recipient_jurisdictions and transfer_mechanism are public, version-bound fields. Either party can establish which version was in effect at a stated time.

7.3.2; Introduction

Consent enabling

The Anchored Notice Receipt is the proof of notice on which valid consent depends. Authorization receipts link back to it; a secondary purpose gets its own receipt.

3.4; 7.2.2; D.2

Personal data control

An individual-held, portable record with a privacy access point for exercising rights. Each purpose can be given, altered, restricted, objected to or withdrawn.

B.2; 7.2.5

AI lifecycle governance and cross-border security requirements are left to companion specifications (B.3).

Clauses: 3.4; 5.1; 7.2.2; 7.2.4; 7.2.5; 7.3.2; 7.4.4; 7.5; B.2; B.3; D.2

Operational transparency for security and privacy interoperability

	SC 27 work item	What the notice record and receipt supply
AI	ISO/IEC FDIS 27091, Annex B.4; ISO/IEC 42001 (B.3)	Processing events bound to the notice version and recorded purpose, so unbound processing is detectable (7.4.4, 7.5). Machine readable notice with a verification procedure for software agents and audit tooling (7.2, 7.2.4)
Digital wallets	Registered gap, PWI of SC 27 Resolution 2026/32 (F.2)	B2 as the individual held wallet record. Micro credential and portable token traceable to the Anchored Notice Receipt, preventing replay across relying parties (D.3, D.4). One access point works without a credential (3.15, 7.1.3)
Digital twins	ISO/IEC WD TS 27568	Flows to and from a twin bound to the accountable controller, notice version and purpose they rely on (7.4.4, 7.5). No twin specific fields are specified
Age assurance	ISO/IEC WD 27566-2, Annex F practice statements (B.3)	The controller of the check is resolvable before any demand for identification (C1). The receipt needs no account or person identifier (C3, 7.3.1). Non-exclusion (C7)

Security of the evidence: hash verified notice versions (7.2.4), an append only log (3.5), and notary proofs where profile B5 applies (B.5.3).

Work items are named as in the Foreword, at their stages on the date of the Extension (2.2). No claim is made about their content.

Clauses: Foreword; 2.2; 3.5; 3.15; 5.1; 7.1.3; 7.2; 7.2.4; 7.3.1; 7.4.4; 7.5; B.2; B.3; B.5.3; D.3; D.4; F.2

Status and next steps

Release 1, 23 September 2026. v1.0 Release Candidate, under candidate review and approval by the ANCR Working Group, then toward a Kantara Initiative Recommendation.

Open terms. Kantara Initiative patent and copyright terms: reciprocal royalty free, with opt out to RAND.

To WG 5. The Working Group approved version is intended for circulation to WG 5 as a liaison contribution, in continuity with WG 5 N 5211.

Offered as implementation reference for:

- ISO/IEC 27560 (revision); ISO/IEC WD TS 27568; ISO/IEC FDIS 27091, Annex B.4; ISO/IEC WD 27566-2, Annex F
- The preliminary work item registered by SC 27 Resolution 2026/32, with a crosswalk in Annex F
- The ISO/IEC JTC 1/SC 44/WG 1 preliminary work item established on 3 September 2026

Text: github.com/KantaraInitiative/ancr-wg, folder ancr-ts-27560-extension

Comments are welcome through the ANCR Working Group. The structural question is for agenda item 21.

Clauses: Front matter; Foreword; 2.2; Annex F

Proposal: an ad hoc group on notice and consent records

Purpose	A broader look at how notice and consent records fit together across WG 5 work, so each item can rely on the others.
Scope	29184, TS 27560:2023, the 27560 revision, PWI 26689, and 27091, 27566-2 and 27568. No change to any document's text or schedule.
Method	The requirements-mapping table already agreed for PWI 26689, and a short common vocabulary.
Membership	Open to all WG 5 experts. Liaison contributions welcome.
Output	A mapping and recommendations, reported to WG 5 at the next meeting.

Suggested next step: a resolution at the closing plenary to establish the group. It complements the committee draft rather than revisiting it.

Clauses: Requirements-mapping method agreed for PWI 26689, 30 July 2026; Extension Foreword

PWI 26689: a three part solution

Agenda item 21

Part 1, notice records and receipts: the base extension

Part 2, PII processing records: profile B1

Part 3, personal data control records: profile B2

All welcome. No prior involvement in either item is needed.

Backup: co-regulation conformance criteria C1 to C8

C1 Sequence	A resolvable Controller Identity Record is available before any demand for personal identification
C2 Minimum notice disclosure	The elements of 3.13 are resolvable at the time of the disclosure event
C3 Anonymity by default	The Anchored Notice Receipt is generable and verifiable without an account_id or a pii_principal_id
C4 Public rule reference	The Notice Record states the code of conduct, code of practice or legal instrument relied upon
C5 Evidence	Log entries for issuance and each material change; receipts bind to a version whose notice_hash matches
C6 Reciprocal and proportionate disclosure	The 7.2.1 disclosure set is published and bound to the version in effect
C7 Non-exclusion	At least one privacy access point works without a digital identification credential
C8 Authorization state	One Authorization State Object; each change logged; the state at a past time is reconstructable

Conformance is asserted per notice version, not per organization.

Clauses: 5.1; 8
